

input 5

THE Camera Profiling Software

Digital camera profiling for RAW, DNG, TIFF and JPEG in a single application.

If critical color accuracy from your scans or digital camera files is required, you need basIColor input 5. Analyzing the capture results of a camera target determines the reproduction characteristics of the camera. This helps to eliminate unnecessary color retouching. Profiling with basIColor input 5 will result in higher data quality and thus will achieve quicker turn-around times.

basIColor input 5 distinguishes automatically between RAW and DNG or TIFF and JPEG formats and creates DCP or ICC profiles with perfect shadow detail.

Multi-Target Profiling

This unique feature of basIColor input 5 allows to combine several target shots into one profile. Reproduction of paints, textiles, non-standard media and use of diverse colorants requires additional charac-

terization. The resulting ICC input profile thus reduces metamerism failure.

Raw Profiling

Beside the ICC profiling input 5 detects (almost) every RAW format and creates DCPs, which can be used in Adobe Camera Raw or Lightroom immediately.

Capture One Pro Profiling

basIColor input 5 is the only solution in the market that makes ICC profiles specifically for Phase One's Capture One Pro straight from RAW camera data.

Spotcolor Correction

Whether including a logo color, corporate identity element, or architectural element which demands absolute matching, the unique qualities of basIColor input will aid in achieving best quality results from the digital photographic image.

DCAM MINI TARGET

The new basIColor dcam mini camera target (optional) has been designed for even better profile quality. It is absolutely matt for reduced reflection, small enough for uniform lighting and holds a sufficient number of patches for highest profile quality.
